1. Problem Statement

The goal of this project is to analyse customer churn in a fintech company. I wanted to understand what factors are contributing to the high churn rate and how it is affecting the company's growth and revenue.

2. Dataset Description

The dataset contains customer information such as customer ID, surname, age, gender, geography, credit score, balance, estimated salary, number of products, and whether the customer has exited or not. This dataset helps in understanding customer behaviour and supports further analysis of churn.

3. Approach

First, I cleaned the raw dataset in Excel by removing blank rows and columns, duplicate records, handling missing values, and fixing data formatting.

Then, I analyzed the overall churn percentage and explored patterns affecting churn. I also performed segment analysis based on age, number of products, activity status, and geography.

After that, I used SQL to perform the same analysis and validate my findings by calculating churn percentages across different segments.

4.Key Insights

I found that around 20% of customers are churning, and most of them are inactive.
I also noticed that customers in the age group of 30–50 contribute significantly to the churn.

Another key factor is the number of products used — customers who are using only one product tend to churn more.

When I combined these factors, I identified a high-risk segment of customers who are inactive and using only one product, which can impact the company's revenue and growth.

I also observed that regions like France and Germany have a higher number of churned customers, mainly due to inactive users, although geography alone is not the primary factor affecting churn.

5. Recommendations

Based on my analysis, I think the company should focus on improving customer engagement and product usage.

- Build awareness about different products through marketing and direct customer engagement
- Improve the application UI to make it more user-friendly and easy to use
- Provide offers and incentives to encourage customers to try multiple products
- Focus more on customer engagement rather than only acquiring new customers
- Promote multi-product usage to increase customer stickiness
- Track inactive users early and take actions to re-engage them
